With SAP2000, SAP are not only delivering a new generation in terms of user interface and performance, they are also delivering one of the most powerful business intelligence and data warehousing solutions in the market. The customer

experience Being a large company that does not rely on SAP user base for sales and marketing as many other companies do, Kodak elected not to pursue a customised business model. Instead, Kodak decided to leverage their existing, large user base by offering a white-label solution, that is the ability to display the name of the client on the software and use any of the customer's existing software. White-label solutions is actually not a new concept to Kodak. Most of Kodak's high-end solutions such as IBIS and Hyperion were offered as white-label solutions for most of their large clients. A white-label solution is actually a product design that requires a least 100 users. The design and development of the solution is then delivered by the SAP partner company in a similar way that a customer would purchase a software from SAP themselves. Kodak has been using SAP2000 since 1994, and had a large installed base that was used in marketing, sales, and planning. This gave Kodak the opportunity to create the marketing and sales suite, that is to be used as the base for the white-label solution. The product is currently also available as an upgrade for existing SAP2000 installations. The white-label business management software consists of the marketing and sales module, and the planning module. An upgraded white-label solution consists of an additional module called the management of manufacturing. The marketing and sales module is based on the standard marketing and sales module that was released for E-Business Suite in 2001. The planning module was developed for the white-label solution specifically to support the white-label solution. The solution is intended to be used by large manufacturers, where there is an ongoing need to predict and forecast the demand for new products and services. In such a scenario, the white-label solution is usually preferred by the clients, since the white-label solution uses the same relational database and the same set of rules and configuration settings as the original system. The white-label solution is also integrated with external systems such as SAP Business Warehouse for out-of-the-box data warehousing and business intelligence functionality. SAP2000 is also scalable, and can be upgraded in the future to support 82157476af
